Gameloft Saigon

Ho Chi Minh City, Vietnam

Re: Application for AI Engineer Intern (Game Development)

Dear Hiring Team,

I am writing to apply for the AI Engineer Intern position at Gameloft Saigon. As a fourth-year Information Technology student at the Posts and Telecommunications Institute of Technology (PTIT) focused on Computer Vision, I am drawn to this role because it sits at the intersection of two things I genuinely care about: building reliable datasets at production scale, and seeing that work power a real product that users—including children using Appplaydu—rely on every day.

Over the past year I have completed three personal CV projects, and the common thread among them is dataset preparation rather than model novelty. In my Real-Time Face Mask Compliance Detection System, I converted PWMFD from PASCAL VOC to YOLO format (9,205 images, 18,528 labelled instances), built audit scripts that surface malformed labels and class-distribution imbalance, and trained YOLOv8n to a validation mAP@50 of 0.970—while transparently documenting the underrepresented *incorrect_mask* class and its impact on per-class recall. I have also planned a dataset extension with hand-occlusion subclasses, because I noticed that real cameras often capture users mid-gesture and a model trained only on clean frames will fail silently in deployment.

What I would like to mention modestly is a small habit of building lightweight tools when existing options do not quite fit the workflow. For my FallGuard project, I built a Streamlit-based labeling assistant that auto-suggests 13-keypoint pose skeletons via YOLO-Pose, then routes each frame through a human-in-the-loop review UI with confidence display, label correction, uncertain/exclude actions, and manual keypoint editing. It is not a replacement for industry tools, but the experience taught me that small productivity-focused tooling—designed around the actual review bottleneck—can shorten an annotation cycle meaningfully and produce cleaner data than brute-force manual labeling.

I would also like to be transparent about one current limitation: my spoken English is at a basic level. I can read technical documentation and follow written communication comfortably, but my conversational fluency is limited to simple words and sentences. I am actively working to improve it, and I prefer to ask for clarification rather than guess when something is unclear.

I am available to commit full-time (5 days per week) for the duration of the internship and can start at the team's convenience. I would be glad to discuss how I can contribute to dataset quality, annotation workflows, and edge-case handling for the team's ongoing CV projects. Thank you for considering my application.

Sincerely,

Nguyen Khac Bao
